**Abstract:** In this paper, we introduce new type of continuous functions called strongly wgr $\alpha$ -continuous and perfectly wgr $\alpha$ -continuous and study some of its properties. Also we introduce the concept of wgr $\alpha$ -compact spaces and wgr $\alpha$ -connected spaces and some their properties are analyzed.

**Subject Classification:** 54C05, 54C10.

**Keywords:** perfectly wgr $\alpha$ -continuous, strongly wgr $\alpha$ -continuous, wgr $\alpha$ -compact spaces and wgr $\alpha$ -connected spaces.

### I. Introduction

Balachandran et al in [9, 10] introduced the concept of generalized continuous maps of a topological space. A property of gpr continuous functions was discussed by Y.Gnanambal and Balachandran K [5]. Strong forms of continuity and generalization of perfect functions were introduced and discussed by T.Noiri [11, 12]. Regular  $\alpha$ -open set is introduced by A.Vadivel and K. Vairamanickam [14]. Rg-compact spaces and rg-connected spaces,  $\tau^*$ -generalized compact spaces and  $\tau^*$ -generalized connected spaces, gb-compactness and gb-connectedness introduced by A.M.Al.Shibani [1], S.Eswaran and A.Pushpalatha [4], S.S.Benchalli and Priyanka M.Bansali [2] respectively. In this paper we establish the relationship between perfectly wgr $\alpha$ -continuous and strongly wgr $\alpha$ -continuous. Also we introduce the concept of wgr $\alpha$ -compact spaces and wgr $\alpha$ -connected spaces and study their properties using wgr $\alpha$ -continuous functions.

### II. Preliminary Definitions

**Definition: 2.1**

A subset A of a topological space  $(X, \tau)$  is called  $\alpha$ -closed [10] if  $A \subset \text{int}(\text{cl}(\text{int}(A)))$ .

**Definition:2.2**

A subset A of a topological space  $(X, \tau)$  is called g $\alpha$ -closed [9] if  $\alpha\text{cl}(A) \subset U$ , when ever  $A \subset U$  and U is  $\alpha$ -open in X.

**Definition: 2.3**

A subset A of a topological space  $(X, \tau)$  is called rwg-closed [14] if  $\text{cl}(\text{int}(A)) \subset U$ , whenever  $A \subset U$  and U is regular-open in X.

**Definition: 2.4**

A map  $f: X \rightarrow Y$  is said to be continuous [3] if  $f^{-1}(V)$  is closed in X for every closed set V in Y.

**Definition: 2.5**

A map  $f: X \rightarrow Y$  is said to be wgr $\alpha$ - continuous [6] if  $f^{-1}(V)$  is wgr $\alpha$ -closed in X for every closed set V in Y.

**Definition: 2.6**

A map  $f: X \rightarrow Y$  is said to be perfectly-continuous [12] if  $f^{-1}(V)$  is clopen in X for every open set V in Y.

**Definition: 2.7**

A map  $f: X \rightarrow Y$  is said to be strongly-continuous [8] if  $f^{-1}(V)$  is clopen in X for every subset V in Y.

**Definition: 2.8**

A function  $f: X \rightarrow Y$  is called wgr $\alpha$ - irresolute [6] if every  $f^{-1}(V)$  is wgr $\alpha$ -closed in X for every wgr $\alpha$ -closed set V of Y.

**Definition: 2.9**

A function  $f: X \rightarrow Y$  is said to be wgr $\alpha$ -open [7] if  $f(V)$  is wgr $\alpha$ -open in Y for every open set V of X.

**Definition: 2.10**

A function  $f: X \rightarrow Y$  is said to be pre wgr $\alpha$ -open [7] if  $f(V)$  is wgr $\alpha$ -open in Y for every wgr $\alpha$ -open set V of X.

**Definition: 2.11**

A space  $(X, \tau)$  is called wgr $\alpha$ - $T_{1/2}$  space[7] if every wgr $\alpha$ -closed set is  $\alpha$ -closed.

**Definition: 2.12**

A space  $(X, \tau)$  is called  $T_{\text{wgr}\alpha}$ -space[7] if every wgr $\alpha$ -closed set is closed.

The complement of the above mentioned closed sets are their respective open sets.

### III. Strongly Wgr $\alpha$ -Continuous and Perfectly Wgr $\alpha$ -Continuous Functions

**Definition: 3.1**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called strongly wgr $\alpha$ -continuous if  $f^{-1}(V)$  is open in  $(X, \tau)$  for every wgr $\alpha$ -open set V of  $(Y, \sigma)$ .

**Definition: 3.2**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called perfectly wgr $\alpha$ -continuous if  $f^{-1}(V)$  is clopen in  $(X, \tau)$  for every wgr $\alpha$ -open set V of  $(Y, \sigma)$ .

**Definition: 3.3**

A function  $f:(X,\tau) \rightarrow (Y,\sigma)$  is called strongly  $wgr\alpha$ - irresolute if  $f^{-1}(V)$  is open in  $(X,\tau)$  for every  $wgr\alpha$ -open set  $V$  of  $(Y,\sigma)$ .

**Definition: 3.4**

A function  $f:(X,\tau) \rightarrow (Y,\sigma)$  is called strongly  $rwg$ -continuous if  $f^{-1}(V)$  is open in  $(X,\tau)$  for every  $rwg$ -open set  $V$  of  $(Y,\sigma)$ .

**Definition: 3.5**

A function  $f:(X,\tau) \rightarrow (Y,\sigma)$  is called perfectly  $rwg$ -continuous if  $f^{-1}(V)$  is clopen in  $(X,\tau)$  for every  $rwg$ -open set  $V$  of  $(Y,\sigma)$ .

**Theorem: 3.6**

If a function  $f:(X,\tau) \rightarrow (Y,\sigma)$  is perfectly  $wgr\alpha$ -continuous, then  $f$  is perfectly continuous.

**Proof**

Let  $F$  be any open set of  $(Y,\sigma)$ . Since every open set is  $wgr\alpha$ -open. We get that  $F$  is  $wgr\alpha$ -open in  $(Y,\sigma)$ . By assumption, we get that  $f^{-1}(F)$  is clopen in  $(X,\tau)$ . Hence  $f$  is perfectly continuous.

**Theorem: 3.7**

If  $f:(X,\tau) \rightarrow (Y,\sigma)$  is strongly  $wgr\alpha$ -continuous, then it is continuous.

**Proof**

Let  $U$  be any open set in  $(Y,\sigma)$ . Since every open set is  $wgr\alpha$ -open,  $U$  is  $wgr\alpha$ -open in  $(Y,\sigma)$ . Then  $f^{-1}(U)$  is open in  $(X,\tau)$ . Hence  $f$  is continuous.

**Remark: 3.8**

Converse of the above theorem need not be true as seen in the following example.

**Example: 3.9**

Let  $X=\{a,b,c,d\}, \tau=\{\phi, X, \{a\}, \{c,d\}, \{a,c,d\}\}$  and  $\sigma=\{\phi, Y, \{a\}, \{b,c\}, \{a,b,c\}\}$ . Define  $f:X \rightarrow Y$  by  $f(a)=a, f(b)=d, f(c)=c, f(d)=b$ . Here  $f$  is continuous, but it is not strongly  $wgr\alpha$ -continuous.

**Theorem: 3.10**

Let  $(X,\tau)$  be any topological space and  $(Y,\sigma)$  be a  $T_{wgr\alpha}$ -space and  $f:(X,\tau) \rightarrow (Y,\sigma)$  be a map. Then the following are equivalent:

- (i)  $f$  is strongly  $wgr\alpha$ -continuous.
- (ii)  $f$  is continuous.

**Proof**

(i)  $\Rightarrow$  (ii) Let  $U$  be any open set in  $(Y,\sigma)$ . Since every open set is  $wgr\alpha$ -open,  $U$  is  $wgr\alpha$ -open in  $(Y,\sigma)$ . Then  $f^{-1}(U)$  is open in  $(X,\tau)$ . Hence  $f$  is continuous.

(ii)  $\Rightarrow$  (i) Let  $U$  be any  $wgr\alpha$ -open set in  $(Y,\sigma)$ . Since  $(Y,\sigma)$  is a  $T_{wgr\alpha}$ -space,  $U$  is open in  $(Y,\sigma)$ . Since  $f$  is continuous. Then  $f^{-1}(U)$  is open in  $(X,\tau)$ . Hence  $f$  is strongly  $wgr\alpha$ -continuous.

**Theorem: 3.11**

If  $f:(X,\tau) \rightarrow (Y,\sigma)$  is strongly  $rwg$ -continuous, then it is strongly  $wgr\alpha$ - continuous.

**Proof**

Let  $U$  be any  $wgr\alpha$ -open set in  $(Y,\sigma)$ . By hypothesis,  $f^{-1}(U)$  is open and closed in  $(X,\tau)$ . Hence  $f$  is strongly  $wgr\alpha$ -continuous.

**Remark: 3.12**

Converse of the above theorem need not be true as seen in the following example.

**Example: 3.13**

Let  $X=\{a,b,c\}, \tau=\sigma=\{\phi, X, \{a\}, \{b\}, \{a,b\}\}$ . Define map  $f:X \rightarrow Y$  is an identity map. Here  $f$  is strongly  $wgr\alpha$ -continuous, but it is not strongly  $rwg$ -continuous.

**Theorem: 3.14**

Let  $f:(X,\tau) \rightarrow (Y,\sigma)$  be a map. Both  $(X,\tau)$  and  $(Y,\sigma)$  are  $T_{wgr\alpha}$ -space. Then the following are equivalent:

- (i)  $f$  is  $wgr\alpha$ -irresolute.
- (ii)  $f$  is strongly  $wgr\alpha$ -continuous.
- (iii)  $f$  is continuous.
- (iv)  $f$  is  $wgr\alpha$ -continuous.

**Proof**

Straight forward.

**Theorem: 3.15**

If  $f:(X,\tau) \rightarrow (Y,\sigma)$  is strongly  $wgr\alpha$ -continuous and  $A$  is open subset of  $X$ , then the restriction  $f|_A:A \rightarrow Y$  is strongly  $wgr\alpha$ -continuous.

**Proof**

Let  $V$  be any  $wgr\alpha$ -closed set of  $Y$ . Since  $f$  is strongly  $wgr\alpha$ -continuous, then  $f^{-1}(V)$  is open in  $(X,\tau)$ . Since  $A$  is open in  $X, (f|_A)^{-1}(V)=A \cap f^{-1}(V)$  is open in  $A$ . Hence  $f|_A$  is strongly  $wgr\alpha$ -continuous.

**Theorem: 3.16**

If a function  $f:(X,\tau) \rightarrow (Y,\sigma)$  is perfectly  $wgr\alpha$ -continuous, then  $f$  is strongly  $wgr\alpha$ -continuous.

**Proof**

Let  $F$  be any  $wgr\alpha$ -open set of  $(Y,\sigma)$ . By assumption, we get that  $f^{-1}(F)$  is clopen in  $(X,\tau)$ , which implies that  $f^{-1}(F)$  is closed and open in  $(X,\tau)$ . Hence  $f$  is strongly  $wgr\alpha$ -continuous.

**Remark: 3.17**

Converse of the above theorem need not be true as seen in the following example.

**Example: 3.18**

Let  $X = \{a, b, c\}, \tau = \{\emptyset, X, \{a\}, \{c\}, \{a, c\}\} = \sigma$ . Define  $f: X \rightarrow Y$  by  $f(a)=a, f(b)=b, f(c)=c$ . Here  $f$  is strongly  $w\alpha$ -continuous, but it is not perfectly  $w\alpha$ -continuous.

**Theorem: 3.19**

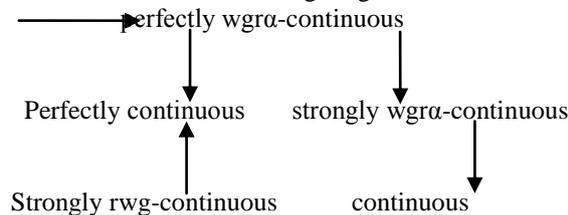

If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is perfectly  $w\alpha$ -continuous, then it is perfectly  $w\alpha$ -continuous.

**Proof**

As  $f$  is strongly continuous,  $f^{-1}(U)$  is both open and closed in  $(X, \tau)$  for every  $w\alpha$ -open set  $U$  in  $(Y, \sigma)$ . Hence  $f$  is perfectly  $w\alpha$ -continuous.

**Remark: 3.20**

The above discussions are summarized in the following diagram.

**Theorem: 3.21**

Let  $(X, \tau)$  be a discrete topological space and  $(Y, \sigma)$  be any topological space. Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a map. Then the following statements are equivalent:

- (i)  $f$  is strongly  $w\alpha$ -continuous.
- (ii)  $f$  is perfectly  $w\alpha$ -continuous.

**Proof**

(i)  $\Rightarrow$  (ii) Let  $U$  be any  $w\alpha$ -open set in  $(Y, \sigma)$ . By hypothesis  $f^{-1}(U)$  is open in  $(X, \tau)$ . Since  $(X, \tau)$  is a discrete space,  $f^{-1}(U)$  is also closed in  $(X, \tau)$ .  $f^{-1}(U)$  is both open and closed in  $(X, \tau)$ . Hence  $f$  is perfectly  $w\alpha$ -continuous.

(ii)  $\Rightarrow$  (i) Let  $U$  be any  $w\alpha$ -open set in  $(Y, \sigma)$ . Then  $f^{-1}(U)$  is both open and closed in  $(X, \tau)$ . Hence  $f$  is strongly  $w\alpha$ -continuous.

**Theorem: 3.22**

If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \mu)$  are perfectly  $w\alpha$ -continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is also perfectly  $w\alpha$ -continuous.

**Proof**

Let  $U$  be a  $w\alpha$ -open set in  $(Z, \mu)$ . Since  $g$  is perfectly  $w\alpha$ -continuous, we get that  $g^{-1}(U)$  is open and closed in  $(Y, \sigma)$ . As any open set is  $w\alpha$ -open in  $(X, \tau)$  and  $f$  is also strongly  $w\alpha$ -continuous,  $f^{-1}(g^{-1}(U)) = (g \circ f)^{-1}(U)$  is both open and closed in  $(X, \tau)$ . Hence  $g \circ f$  is perfectly  $w\alpha$ -continuous.

**Theorem: 3.23**

If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \mu)$  be any two maps. Then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is

- (i)  $w\alpha$ -irresolute if  $g$  is strongly  $w\alpha$ -continuous and  $f$  is  $w\alpha$ -continuous.
- (ii) Strongly  $w\alpha$ -continuous if  $g$  is perfectly  $w\alpha$ -continuous and  $f$  is continuous.
- (iii) Perfectly  $w\alpha$ -continuous if  $g$  is strongly  $w\alpha$ -continuous and  $f$  is perfectly  $w\alpha$ -continuous.

**Proof**

(i) Let  $U$  be a  $w\alpha$ -open set in  $(Z, \mu)$ . Then  $g^{-1}(U)$  is open in  $(Y, \sigma)$ . Since  $f$  is  $w\alpha$ -continuous,  $f^{-1}(g^{-1}(U)) = (g \circ f)^{-1}(U)$  is  $w\alpha$ -open in  $(X, \tau)$ . Hence  $g \circ f$  is  $w\alpha$ -irresolute.

(ii) Let  $U$  be any  $w\alpha$ -open set in  $(Z, \mu)$ . Then  $g^{-1}(U)$  is both open and closed in  $(Y, \sigma)$  and therefore  $f^{-1}(g^{-1}(U)) = (g \circ f)^{-1}(U)$  is both open and closed in  $(X, \tau)$ . Hence  $g \circ f$  is strongly  $w\alpha$ -continuous.

(iii) Let  $U$  be any  $w\alpha$ -open set in  $(Z, \mu)$ . Then  $g^{-1}(U)$  is open and closed in  $(Y, \sigma)$ . By hypothesis,  $f^{-1}(g^{-1}(U))$  is both open and closed in  $(X, \tau)$ . Hence  $g \circ f$  is perfectly  $w\alpha$ -continuous.

**Theorem: 3.24**

If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \mu)$  are strongly  $w\alpha$ -continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is also strongly  $w\alpha$ -continuous.

**Proof**

Let  $U$  be a  $w\alpha$ -open set in  $(Z, \mu)$ . Since  $g$  is strongly  $w\alpha$ -continuous, we get that  $g^{-1}(U)$  is open in  $(Y, \sigma)$ . It is  $w\alpha$ -open in  $(Y, \sigma)$ . As  $f$  is also strongly  $w\alpha$ -continuous,  $f^{-1}(g^{-1}(U)) = (g \circ f)^{-1}(U)$  is open in  $(X, \tau)$ . Hence  $g \circ f$  is continuous.

**Theorem: 3.25**

If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \mu)$  be any two maps. Then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is (i) strongly  $w\alpha$ -continuous if  $g$  is strongly  $w\alpha$ -continuous and  $f$  is continuous.

- (ii)  $w\alpha$ -irresolute if  $g$  is strongly  $w\alpha$ -continuous and  $f$  is  $w\alpha$ -continuous.
- (iii) Continuous if  $g$  is  $w\alpha$ -continuous and  $f$  is strongly  $w\alpha$ -continuous.

**Proof**

(i) Let  $U$  be a  $w\alpha$ -open set in  $(Z, \mu)$ . Since  $g$  is strongly  $w\alpha$ -continuous,  $g^{-1}(U)$  is open in  $(Y, \sigma)$ . Since  $f$  is continuous,  $f^{-1}(g^{-1}(U)) = (g \circ f)^{-1}(U)$  is open in  $(X, \tau)$ . Hence  $g \circ f$  is strongly  $w\alpha$ -continuous.

(ii) Let  $U$  be a  $wgr\alpha$ -open set in  $(Z, \mu)$ . Since  $g$  is strongly  $wgr\alpha$ -continuous,  $g^{-1}(U)$  is open in  $(Y, \sigma)$ . As  $f$  is  $wgr\alpha$ -continuous,  $f^{-1}(g^{-1}(U)) = (g \circ f)^{-1}(U)$  is  $wgr\alpha$ -open in  $(X, \tau)$ . Hence  $g \circ f$  is  $wgr\alpha$ -irresolute.

(iii) Let  $U$  be any open set in  $(Z, \mu)$ . Since  $g$  is  $wgr\alpha$ -continuous,  $g^{-1}(U)$  is  $wgr\alpha$ -open in  $(Y, \sigma)$ . As  $f$  is strongly  $wgr\alpha$ -continuous,  $f^{-1}(g^{-1}(U)) = (g \circ f)^{-1}(U)$  is open in  $(X, \tau)$ . Hence  $g \circ f$  is continuous.

**Theorem: 3.26**

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \tau) \rightarrow (Z, \eta)$  be two mappings and let  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  be  $wgr\alpha$ -closed. If  $g$  is strongly  $wgr\alpha$ -irresolute and bijective, then  $f$  is closed.

**Proof**

Let  $A$  be closed in  $(X, \tau)$ , then  $(g \circ f)(A)$  is  $wgr\alpha$ -closed in  $(Z, \eta)$ . Since  $g$  is strongly  $wgr\alpha$ -irresolute,  $g^{-1}(g \circ f)(A) = f(A)$  is closed in  $(Y, \sigma)$ . Hence  $f(A)$  is closed.

**Theorem: 3.27**

If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is perfectly  $wgr\alpha$ -continuous and  $A$  is any subset of  $X$ , then the restriction  $f|_A: A \rightarrow Y$  is also perfectly  $wgr\alpha$ -continuous.

**Proof**

Let  $V$  be any  $wgr\alpha$ -closed set in  $(Y, \sigma)$ . Since  $f$  is perfectly  $wgr\alpha$ -continuous,  $f^{-1}(V)$  is both open and closed in  $(X, \tau)$ .  $(f|_A)^{-1}(V) = A \cap f^{-1}(V)$  is both open and closed in  $A$ . Hence  $f|_A$  is perfectly  $wgr\alpha$ -continuous.

### IV. Wgr $\square$ -Compact Spaces

**Definition: 4.1**

A collection  $\{A_\alpha: \alpha \in \nabla\}$  of  $wgr\alpha$ -open sets in a topological space  $X$  is called  $wgr\alpha$ -open cover of a subset  $B$  of  $X$  if  $B \subset \cup \{A_\alpha: \alpha \in \nabla\}$  holds.

**Definition: 4.2**

A topological space  $(X, \tau)$  is  $wgr\alpha$ -compact if every  $wgr\alpha$ -open cover of  $X$  has a finite subcover.

**Definition: 4.3**

A subset  $B$  of  $X$  is called  $wgr\alpha$ -compact relative of  $X$  if for every collection  $\{A_\alpha: \alpha \in \nabla\}$  of  $wgr\alpha$ -open subsets of  $X$  such that  $B \subset \cup \{A_\alpha: \alpha \in \nabla\}$ , there exists a finite subset  $\nabla_0$  of  $\nabla$  such that  $B \subset \cup \{A_\alpha: \alpha \in \nabla_0\}$ .

**Definition: 4.4**

A subset  $B$  of  $X$  is said to be  $wgr\alpha$ -compact if  $B$  is  $wgr\alpha$ -compact subspace of  $X$ .

**Theorem: 4.5**

Every  $wgr\alpha$ -closed subset of a  $wgr\alpha$ -compact space is  $wgr\alpha$ -compact space relative to  $X$ .

**Proof**

Let  $A$  be  $wgr\alpha$ -closed subset of  $X$ , then  $A^c$  is  $wgr\alpha$ -open. Let  $O = \{G_\alpha: \alpha \in \nabla\}$  be a cover of  $A$  by  $wgr\alpha$ -open subsets of  $X$ . Then  $W = O \cup A^c$  is an  $wgr\alpha$ -open cover of  $X$ . That is  $X = (\cup \{G_\alpha: \alpha \in \nabla\}) \cup A^c$ . By hypothesis,  $X$  is  $wgr\alpha$ -compact.

Hence  $W$  has a finite subcover of  $X$  say  $(G_1 \cup G_2 \cup G_3 \cup \dots \cup G_n) \cup A^c$ . But  $A$  and  $A^c$  are disjoint, hence  $A \subset G_1 \cup G_2 \cup \dots \cup G_n$ . So  $O$  contains a finite subcover for  $A$ , therefore  $A$  is  $wgr\alpha$ -compact relative to  $X$ .

**Theorem: 4.6**

Let  $f: X \rightarrow Y$  be a map:

(i) If  $X$  is  $wgr\alpha$ -compact and  $f$  is  $wgr\alpha$ -continuous bijective, then  $Y$  is compact.

(ii) If  $f$  is  $wgr\alpha$ -irresolute and  $B$  is  $wgr\alpha$ -compact relative to  $X$ , then  $f(B)$  is  $wgr\alpha$ -compact relative to  $Y$ .

**Proof**

(i) Let  $f: X \rightarrow Y$  be an  $wgr\alpha$ -continuous bijective map and  $X$  be an  $wgr\alpha$ -compact space. Let  $\{A_\alpha: \alpha \in \nabla\}$  be an open cover for  $Y$ . Then  $\{f^{-1}(A_\alpha): \alpha \in \nabla\}$  is an  $wgr\alpha$ -open cover of  $X$ . Since  $X$  is  $wgr\alpha$ -compact, it has finite subcover say  $\{f^{-1}(A_1), f^{-1}(A_2), \dots, f^{-1}(A_n)\}$ , but  $f$  is surjective, so  $\{A_1, A_2, \dots, A_n\}$  is a finite subcover of  $Y$ .

Therefore  $Y$  is compact.

(ii) Let  $B \subset X$  be  $wgr\alpha$ -compact relative to  $X$ ,  $\{A_\alpha: \alpha \in \nabla\}$  be any collection of  $wgr\alpha$ -open subsets of  $Y$  such that  $f(B) \subset \cup \{A_\alpha: \alpha \in \nabla\}$ . Then  $B \subset \cup \{f^{-1}(A_\alpha): \alpha \in \nabla\}$ . By hypothesis, there exists a finite subset  $\nabla_0$  of  $\nabla$  such that  $f(B) \subset \cup \{A_\alpha: \alpha \in \nabla_0\}$ . Then  $B \subset \cup \{f^{-1}(A_\alpha): \alpha \in \nabla_0\}$ . By hypothesis, there exists a finite subset  $\nabla_0$  of  $\nabla$  such that  $B \subset \cup \{f^{-1}(A_\alpha): \alpha \in \nabla_0\}$ . Therefore, we have  $f(B) \subset \cup \{A_\alpha: \alpha \in \nabla_0\}$  which shows that  $f(B)$  is  $wgr\alpha$ -compact relative to  $Y$ .

**Theorem: 4.7**

If  $f: X \rightarrow Y$  is pre- $wgr\alpha$ -open bijection and  $Y$  is  $wgr\alpha$ -compact space, then  $X$  is a  $wgr\alpha$ -compact space.

**Proof**

Let  $\{U_\alpha : \alpha \in \nabla\}$  be a wgra-open cover of X. So  $X = \bigcup_{\alpha \in \nabla} U_\alpha$  and then  $Y = f(X) = f(\bigcup_{\alpha \in \nabla} U_\alpha) = \bigcup_{\alpha \in \nabla} f(U_\alpha)$ . Since f is prewgra-open, for each  $\alpha \in \nabla$ ,  $f(U_\alpha)$  is wgra-open set. By hypothesis, there exists a finite subset  $\nabla_o$  of  $\nabla$  such that  $Y = \bigcup_{\alpha \in \nabla_o} f(U_\alpha)$ .

Therefore,  $X = f^{-1}(Y) = f^{-1}(\bigcup_{\alpha \in \nabla_o} f(U_\alpha)) = \bigcup_{\alpha \in \nabla_o} U_\alpha$ . This shows that X is wgra-compact.

**Theorem: 4.8**

If  $f: X \rightarrow Y$  is wgra-irresolute bijection and X is wgra-compact space, then Y is a wgra-compact space.

**Proof**

Let  $\{U_\alpha : \alpha \in \nabla\}$  be a wgra-open cover of Y. So  $Y = \bigcup_{\alpha \in \nabla} U_\alpha$  and then  $X = f^{-1}(Y) = f^{-1}(\bigcup_{\alpha \in \nabla} U_\alpha) = \bigcup_{\alpha \in \nabla} f^{-1}(U_\alpha)$ . Since f is wgra-irresolute, it follows that for each  $\alpha \in \nabla$ ,  $f^{-1}(U_\alpha)$  is wgra-open set. By wgra-compactness of X, there exists a finite subset  $\nabla_o$  of  $\nabla$  such that  $X = \bigcup_{\alpha \in \nabla_o} f^{-1}(U_\alpha)$ . Therefore,  $Y = f(X) = f(\bigcup_{\alpha \in \nabla_o} f^{-1}(U_\alpha)) = \bigcup_{\alpha \in \nabla_o} U_\alpha$ . This shows that Y is wgra-compact.

**Theorem: 4.9**

A wgra-continuous image of a wgra-compact space is compact.

**Proof**

Let  $f: X \rightarrow Y$  be a wgra-continuous map from a wgra-compact space X onto a topological space Y. let  $\{A_i : i \in \nabla\}$  be an open cover of Y. Then  $\{f^{-1}(A_i) : i \in \nabla\}$  is wgra-open cover of X. Since X is wgra-compact, it has finite subcover, say  $\{f^{-1}(A_1), f^{-1}(A_2), \dots, f^{-1}(A_n)\}$ . Since f is onto,  $\{A_1, A_2, \dots, A_n\}$  and so Y is compact.

**Theorem: 4.10**

A space X is wgra-compact if and only if each family of wgra-closed subsets of X with the finite intersection property has a non-empty intersection.

**Proof**

X is wgra-compact and A is any collection of wgra-closed sets with F.I.P. Let  $A = \{F_\alpha : \alpha \in \nabla\}$  be an arbitrary collection of wgra-closed subsets of X with F.I.P, so that  $\bigcap \{F_{\alpha_i} : i \in \nabla_o\} \neq \emptyset \rightarrow (1)$ , we have to prove that the collection A has non-empty intersection, that is,  $\bigcap \{F_\alpha : \alpha \in \nabla\} \neq \emptyset \rightarrow (2)$ . Let us assume that the above condition does not hold and hence  $\bigcap \{F_\alpha : \alpha \in \nabla\} = \emptyset$ . Taking complements of both sides, we get  $\bigcup \{F_\alpha^c : \alpha \in \nabla\} = X \rightarrow (3)$ . But each  $F_\alpha$  being wgra-closed, which implies that  $F_\alpha^c$  is wgra-open and hence from (3), we conclude that  $C = \{F_\alpha^c : \alpha \in \nabla\}$  is a wgra open cover of X. Since X is wgra-compact, this cover C has a finite subcover.  $C = \{F_{\alpha_i}^c : i \in \nabla_o\}$  is also an open subcover. Therefore  $X = \bigcup \{F_{\alpha_i}^c : i \in \nabla_o\}$ . Taking complement, we get  $\emptyset = \bigcap \{F_{\alpha_i} : i \in \nabla_o\}$  which is a contradiction of (1). Hence  $\bigcap \{F_\alpha : \alpha \in \nabla\} \neq \emptyset$ . Conversely, suppose any collection of wgra-closed sets with F.I.P has an empty intersection. Let  $C = \{G_\alpha : \alpha \in \nabla\}$ , where  $G_\alpha$  is a wgra-open cover of X and hence  $X = \bigcup \{G_\alpha : \alpha \in \nabla\}$ . Taking complements, we have  $\emptyset = \bigcap \{G_\alpha^c : \alpha \in \nabla\}$ . But  $G_\alpha^c$  is wgra-closed. Therefore the class A of wgra-closed subsets with empty intersection. So that it does not have F.I.P. Hence there exists a finite number of wgra-closed sets  $G_{\alpha_i}^c$  such that  $i \in \nabla_o$  with empty intersection. That is,  $\bigcap \{G_{\alpha_i}^c : i \in \nabla_o\} = \emptyset$ . Taking complement, we have  $\{G_{\alpha_i} : i \in \nabla_o\} = X$ . Therefore C of X has an open subcover  $C^* = \{G_{\alpha_i} : i \in \nabla_o\}$ . Hence  $(X, \tau)$  is compact.

**Theorem :4.11**

If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a strongly wgra-continuous onto map, where  $(X, \tau)$  is a compact space, then  $(Y, \sigma)$  is wgra-compact.

**Proof**

Let  $\{A_i : i \in \nabla\}$  be a wgra-open cover of  $(Y, \sigma)$ . Since f is strongly wgra-continuous,  $\{f^{-1}(A_i) : i \in \nabla\}$  is an open cover  $(X, \tau)$ . As  $(X, \tau)$  is compact, it has a finite subcover say,  $\{f^{-1}(A_1), f^{-1}(A_2), \dots, f^{-1}(A_n)\}$  and since f is onto,  $\{A_1, A_2, \dots, A_n\}$  is a finite subcover of  $(Y, \sigma)$  and therefore  $(Y, \sigma)$  is wgra-compact.

**Theorem :4.12**

If a map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a perfectly wgra-continuous onto map, where  $(X, \tau)$  is compact, then  $(Y, \sigma)$  is wgra-compact.

**Proof**

Since every perfectly wgra-continuous function is strongly wgra-continuous. Therefore by theorem 4.11,  $(Y, \sigma)$  is wgra-compact.

## V. Wgr □-Connected Spaces

**Definition: 5.1**

A Space X is said to be wgra-connected if it cannot be written as a disjoint union of two non-empty wgra-open sets.

**Definition: 5.2**

A subset of  $X$  is said to be  $wgr\alpha$ -connected if it is  $wgr\alpha$ -connected as a subspace of  $X$ .

**Definition: 5.3**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called contra  $wgr\alpha$ -continuous if  $f^{-1}(V)$  is  $wgr\alpha$ -closed in  $(X, \tau)$  for each open set  $V$  in  $(Y, \sigma)$ .

**Theorem: 5.4**

For a space  $X$ , the following statements are equivalent

- (i)  $X$  is  $wgr\alpha$ -connected.
- (ii)  $X$  and  $\emptyset$  are the only subsets of  $X$  which are both  $wgr\alpha$ -open and  $wgr\alpha$ -closed.
- (iii) Each  $wgr\alpha$ -continuous map of  $X$  into some discrete space  $Y$  with atleast two points is a constant map.

**Proof**

(i)  $\Rightarrow$  (ii) Let  $X$  be  $wgr\alpha$ -connected. Let  $A$  be  $wgr\alpha$ -open and  $wgr\alpha$ -closed subset of  $X$ . Since  $X$  is the disjoint union of the  $wgr\alpha$ -open sets  $A$  and  $A^c$ , one of these sets must be empty. That is,  $A = \emptyset$  or  $A = X$ .

(ii)  $\Rightarrow$  (i) Let  $X$  be not  $wgr\alpha$ -connected, which implies  $X = A \cup B$ , where  $A$  and  $B$  are disjoint non-empty  $wgr\alpha$ -open subsets of  $X$ . Then  $A$  is both  $wgr\alpha$ -open and  $wgr\alpha$ -closed. By assumption  $A = \emptyset$  or  $A = X$ , therefore  $X$  is  $wgr\alpha$ -connected.

(ii)  $\Rightarrow$  (iii) Let  $f: X \rightarrow Y$  be  $wgr\alpha$ -continuous map from  $X$  into discrete space  $Y$  with atleast two points, then  $\{f^{-1}(y): y \in Y\}$  is a cover of  $X$  by  $wgr\alpha$ -open and  $wgr\alpha$ -closed sets. By assumption,  $f^{-1}(y) = \emptyset$  or  $X$  for each  $y \in Y$ . If  $f^{-1}(y) = \emptyset$  for all  $y \in Y$ , then  $f$  is not a map. So there exists a exactly one point  $y \in Y$  such that  $f^{-1}(y) \neq \emptyset$  and hence  $f^{-1}(y) = X$ . This shows that  $f$  is a constant map.

(iii)  $\Rightarrow$  (ii) Let  $O \neq \emptyset$  be both an  $wgr\alpha$ -open and  $wgr\alpha$ -closed subset of  $X$ . Let  $f: X \rightarrow Y$  be  $wgr\alpha$ -continuous map defined by  $f(O) = \{y\}$  and  $f(O^c) = \{\omega\}$  for some distinct points  $y$  and  $\omega$  in  $Y$ . By assumption  $f$  is constant, therefore  $O = X$ .

**Theorem: 5.5**

Let  $f: X \rightarrow Y$  be a map:

- (i) If  $X$  is  $wgr\alpha$ -connected and  $f$  is  $wgr\alpha$ -continuous surjective, then  $Y$  is connected.
- (ii) If  $X$  is  $wgr\alpha$ -connected and  $f$  is  $wgr\alpha$ -irresolute surjective, then  $Y$  is  $wgr\alpha$ -connected.

**Proof**

(i) If  $Y$  is not connected, then  $Y = A \cup B$ , where  $A$  and  $B$  are disjoint non-empty open subsets of  $Y$ . Since  $f$  is  $wgr\alpha$ -continuous surjective, therefore  $X = f^{-1}(A) \cup f^{-1}(B)$ , where  $f^{-1}(A)$  and  $f^{-1}(B)$  are disjoint non-empty  $wgr\alpha$ -open subsets of  $X$ . This contradicts the fact that  $X$  is  $wgr\alpha$ -connected. Hence,  $Y$  is connected.

(ii) Suppose that  $Y$  is not  $wgr\alpha$ -connected, then  $Y = A \cup B$ , where  $A$  and  $B$  are disjoint non-empty  $wgr\alpha$ -open subsets of  $Y$ . Since  $f$  is  $wgr\alpha$ -irresolute surjective, therefore  $X = f^{-1}(A) \cup f^{-1}(B)$ , where  $f^{-1}(A), f^{-1}(B)$  are disjoint non-empty  $wgr\alpha$ -open subsets of  $X$ . So  $X$  is not  $wgr\alpha$ -connected, a contradiction.

**Theorem: 5.6**

A contra  $wgr\alpha$ -continuous image of a  $wgr\alpha$ -connected space is connected.

**Proof**

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a contra  $wgr\alpha$ -continuous from a  $wgr\alpha$ -connected space  $X$  onto a space  $Y$ . Assume  $Y$  is not connected. Then  $Y = A \cup B$ , where  $A$  and  $B$  are non-empty closed sets in  $Y$  with  $A \cap B = \emptyset$ . Since  $f$  is contra  $wgr\alpha$ -continuous, we have that  $f^{-1}(A)$  and  $f^{-1}(B)$  are non-empty  $wgr\alpha$ -open sets in  $X$  with  $f^{-1}(A) \cup f^{-1}(B) = f^{-1}(A \cup B) = f^{-1}(Y) = X$  and  $f^{-1}(A) \cap f^{-1}(B) = f^{-1}(A \cap B) = f^{-1}(\emptyset) = \emptyset$ . This means that  $X$  is not  $wgr\alpha$ -connected, which is a contradiction. This proves the theorem.

**Theorem: 5.7**

Every  $wgr\alpha$ -connected space is connected.

**Proof**

Let  $X$  be an  $wgr\alpha$ -connected space. Suppose  $X$  is not connected. Then there exists a proper non-empty subset  $B$  of  $X$  which is both open and closed in  $X$ . Since every closed set is  $wgr\alpha$ -closed,  $B$  is a proper non-empty subsets of  $X$  which is both  $wgr\alpha$ -open and  $wgr\alpha$ -closed in  $X$ . Therefore  $X$  is not  $wgr\alpha$ -connected. This proves the theorem.

**Remark: 5.8**

Converse of the above theorem need not be true as seen in the following example.

**Example: 5.9**

Let  $X = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a, b\}, X\}$ .  $(X, \tau)$  is connected. But  $\{a\}$  and  $\{b\}$  are both  $wgr\alpha$ -closed and  $wgr\alpha$ -open,  $X$  is not  $wgr\alpha$ -connected.

**Theorem: 5.10**

Let  $X$  be a  $T_{wgr\alpha}$ -space. Then  $X$  is  $wgr\alpha$ -connected if  $X$  is connected.

**Proof**

Suppose  $X$  is not  $wgr\alpha$ -connected. Then there exists a proper non-empty subset  $B$  of  $X$  which is both  $wgr\alpha$ -open and  $wgr\alpha$ -closed in  $X$ . Since  $X$  is  $T_{wgr\alpha}$ -space,  $B$  is both open and closed in  $X$  and hence  $X$  is not connected.

**Theorem: 5.11**

Suppose  $X$  is  $wgr\alpha$ - $T_{1/2}$  space. Then  $X$  is  $wgr\alpha$ -connected if and only if  $X$  is  $g\alpha$ -connected

**Proof**

Suppose  $X$  is  $wgr\alpha$ -connected.  $X$  is  $g\alpha$ -connected.

Conversely, we assume that  $X$  is  $g\alpha$ -connected. Suppose  $X$  is not  $wg\alpha$ -connected. Then there exists a proper non-empty subset  $B$  of  $X$  which is both  $wg\alpha$ -open and  $wg\alpha$ -closed in  $X$ . Since  $X$  is  $wg\alpha-T_{1/2}$ -space is both  $\alpha$ -open and  $\alpha$ -closed in  $X$ . Since  $\alpha$ -closed set is  $g\alpha$ -closed in  $X$ ,  $B$  is not  $g\alpha$ -connected in  $X$ , which is a contradiction. Therefore  $X$  is  $wg\alpha$ -connected.

**Theorem: 5.12**

In a topological space  $(X, \tau)$  with at least two points, if  $\alpha O(X, \tau) = \alpha C(X, \tau)$ , then  $X$  is not  $wg\alpha$ -connected.

**Proof**

By hypothesis, we have  $\alpha O(X, \tau) = \alpha C(X, \tau)$  and by the result, we have every  $\alpha$ -closed set is  $wg\alpha$ -closed, there exists some non-empty proper subset of  $X$  which is both  $wg\alpha$ -open and  $wg\alpha$ -closed in  $X$ . So by theorem 5.4, we have  $X$  is not  $wg\alpha$ -connected.
